If you need to protect employees and the community at large as a personal and corporate responsibility, you have to ensure that everyone in the organization consistently drives best safety practices.

Safety is not just about money or business strategy, but about the commitment of an organization to address the most important risks by linking technical factors, roles and procedures with the knowhow stuff and a Safety culture works when every employee commits to minimizing accidents, look out for each other while taking pride in the work they do.

Having a safety culture is the establishment of how things have to be done, thereby setting safety levels and the first thing is to identify the possible causes of serious accidents that:

- *Results in Injuries*
- *Damage the assets*
- *Harmful to the Environment*

The poster is the representation of how Mettler Toledo AutoChem is aligned with this culture and what are the technology adoptions that can be used to prevent the possible causes of serious accidents including the improvement of the working conditions, quality and dialogue which intern influence safety culture.
